## WHY THE LARGE RISE IN THE GERMAN BIRTH-RATE?

P. K. WHELPTON

Scripps Foundation for Research in Population Problems  
Miami University

### ABSTRACT

The rise in the birth-rate from 1933 to 1934 was much larger in Germany than in other countries. This probably is due in part to the Nazi attempts to increase births by preventing abortion and the spreading of birth-control information, and by giving psychical and economic encouragement to larger families. The birth-rate rose in large cities before the remainder of the country, and to a greater degree. The extent of the rise in the various states is correlated with the proportion of the working population engaged in agriculture, the proportion of Catholics, and the 1933 birth-rate. The extent of the rise in various cities is correlated with the last two of these and with the size of the city. Nazis claim that the psychical rebirth of the German people is the chief cause of the higher birth-rate, but there are indications pointing to the importance of the suppressing of abortions.

Preliminary vital statistics for 1934 show that in the Western world there was a general arrest in the decline of the birth-rate which had been going on for a decade or more. In Hungary the birth-rate decreased from 1933 to 1934 less than half as much as it did a year earlier, and in Norway only one-fifth as much.<sup>1</sup> In Poland the rate of 26.5 per 1,000 in 1934 represented no change from 1933, in contrast to a decline of 2.2 from 1932 to 1933. In Great Britain the birth-rate in 1934 is estimated provisionally at 14.8, slightly above the 1933 rate of 14.4, which in turn was well below that of 15.3 in 1932. In the United States the rise from 16.4 in 1933 to 17.1 in 1934 almost brought the birth-rate back to the 1932 figure of 17.3.<sup>2</sup> These changes are dwarfed, however, by Germany's experience. There the birth-rate was 15.1 in 1932, 14.7 in 1933, and 18.0 in 1934. An examination of the vital statistics of countries with reliable data, extending over a century in some cases, shows no gain approaching this in size except as an immediate reaction to an important civil or foreign war.

A slackening of the downward trend of the birth-rate or even a

<sup>1</sup> The rates from 1932 to 1934 were as follows: Hungary, 23.4, 22.0, and 21.4; Norway, 16.0, 15.0, and 14.8; Italy was an exception to the general trend, her rates being 23.8, 23.7, and 23.2.

<sup>2</sup> These are provisional rates from the Bureau of the Census. In 1932 the final rate was 17.4.

That's more like it! 📌

Research shows having a second child worsens parents' mental health

Prior to childbirth, mothers and fathers report similar levels of time pressure. Once the first child is born, time pressure increases for both parents.

THEORETICAL FRAMEWORK

Identification Theory

Identification theory (Kelman, 1961) maintains that people automatically assess their level of similarity with a source during an interaction and make similarity judgments (Hovland & Weiss, 1951; Kelman, 1961). This process drives individuals to choose a model based on perceived similarities between themselves and the

18. ADOLESCENTS' RESPONSES TO CULTURALLY EMBEDDED ADS 323

model (Basow & Howe, 1980; Kelman, 1961). When viewers perceive that the source possesses characteristics such as race that are similar to their own, they begin to infer that the source will also share other characteristics, all of which lead to greater identification (Brock, 1965; Feick & Higie, 1992). Studies have shown that individuals who are more likely to identify with television characters are more affected by the media content in which those characters are engaged (Huesman et al., 1983).

Among Blacks who maintain strong racial identities, awareness of and preference for Black models is heightened. Racial and ethnic identity is a person's knowledge of membership in a social group and the value and emotional significance attached to that membership (Phinney, 1992). Ethnic and racial identity is an important component of the self-concept and can be particularly salient during adolescence (see Appiah, 2001; Phinney, 1992). This notion was supported by Whittler (1991), who found that Black college students who identified more strongly with Black culture also identified more strongly with Black models in advertising compared with Blacks who were low on cultural identification. Whittler's findings may explain why many Black youth who maintain strong racial identities may develop stronger preferences for Black models in ads.

Stop having babies, goy - save yourself the mental agony and save the Earth! Your ancestry, history, culture, and genetic lineage are all social constructs!

Meanwhile in Israel...
